

# train with a hacker... ...think like an attacker

By teaching you how hackers work in the wild, our compressive training will give you the skills you need to develop secure applications.

## web app security

Our web application security training course will set your team up with the skills needed to create secure web applications.

Based on the industry standard for security testing including the OWASP top 10, CREST and NIST, our curriculum will teach you how breaches can occur and how to you can write code that protects against them.

## mobile app security

Our mobile application security training course is relevant to both Android and iOS.

Designed to benefit mobile development teams, we train you to identify the most common mobile vulnerabilities. With this course you'll learn the secure coding practices to keep your mobile apps secure and your customers safe.

## secure coding

In our C and C++ application security training course, we will work with you to explain the types of issues we commonly see on security tests.

Using live samples, training environments and test exercises, we've designed a "security by hackers, for developers" course that gets your team thinking and coding with security baked in.

## offensive hacking

Spend time with our ethical hackers and learn how attackers work. In a safe offline environment, we will help your teams understand how hacking works in the wild.

With these skills your teams can test their own applications by hacking them in the way an attacker would. Sometimes the best defence is offence.
