

# a different approach

GDPR is not only complicated, it's also open to interpretation - we know the regulations, so you don't have to.

Working together to analyse and map the functions of your data, we can help you identify the changes that are relevant to you.

This will help you to become compliant, and more importantly, stay compliant.

## principles of GDPR

We map against the 7 core principles of the GDPR and embed the ethos of good data management.

accuracy  
accountability  
data minimisation  
purpose limitation  
data storage limitation  
lawful fair transparency  
security and confidentiality

## mapping and analysis

Using Functional Analysis we create a map that follows your data's objectives from the point of collection to deletion.

The process will identify any unnecessary activities, high risk areas and changes that you may need to make.

You can then prioritise your investment in how to manage your data securely in a way that works best for you.

## what you give us

Access to your people - you know what you do with your data better than we do.

Information - there are no wrong answers, we can't help you if we don't know what's wrong.

Time - this process takes investment so it's best to take it on when you can dedicate the time.

## what we give you

Maps - showing the changes you have made and reflecting any future changes.

Report - this will demonstrate your approach to security-by-design, a key requirement of the GDPR.

Confidence - we embed good data management and data protection principles in all areas of your business.
