

more than just a test... ...we give you confidence

Being small and agile means you can innovate quickly - one of the key strengths of a FinTech startup. Our approach to continuous security will help you secure your assets without blocking your deployment.

mobile specialists

FinTech is big business. You want to keep your apps, your customers, and their data safe. This means the experts testing your apps really need to know what they're doing.

As specialists in mobile and financial applications we've won bug bounties specific to mobile, and train on secure mobile development. We don't use juniors, only experienced testers.

penetration testing

Your apps are key to your business, and could be your biggest asset. You want to keep that asset secure and we can help you.

Using the same tools as hackers we can infiltrate your applications, exposing vulnerabilities safely, so you can fix them before they become an issue.

DevSecOps

Whether you're a start-up or a larger enterprise, you need to have confidence in the service you're providing. We can equip your teams with the tools they need to develop, test and deploy secure applications with confidence.

We will work with you to transform the basic DevOps process into DevSecOps - integrating security testing at every stage of development, all the way through to deployment.

security training

Our web application security training course is based on the industry standard for security testing including the web and mobile OWASP top 10, CREST and NIST.

Our mobile application security training course is relevant to both Android and iOS. Designed to benefit all technical staff, we'll train your teams on how to embed secure processes themselves.
