more than just a test…
…we give you confidence

We may be small but we're perfectly formed. Our team of experienced and qualified security consultants can help you with the advice you need to fix vulnerabilities rather that just identify them.

application testing

websites & web apps

Your website is key to your business, and if it's the only way you do business, could be your biggest asset. You want to keep that asset secure and we can help you.

We can do more that just scan. Using the same tools as hackers we can infiltrate your website, finding and exposing vulnerabilities safely so you can fix them before they become an issue.

Our testers are on the cutting edge of web app infiltration, and have even made news headlines with their research in virtual reality application security.

mobile apps

Mobile is big business. You and your customers need the same level of protection whether on a web app or mobile app and we can help you deliver that.

The vulnerabilities most common to mobile apps can be different to those on websites. They even have their own OWASP top 10. You want to know the consultant testing your mobile app knows what they're doing.

We're specialists in mobile security. Don't just take our word for it, we've delivered talks and training at international conferences and we've won bug bounties specific to mobile.

network security

network testing

With the GDPR now in force, infrastructure security has never been more scrutinised. If compromised, a breach could cause you major issues. Infrastructure attacks could take your business off-line, release business sensitive information or compromise the personal data of your customers.

With experience in network testing for big banks and governments our infrastructure certified testers can help you protect your network, identifying vulnerabilities and weaknesses that may put your business at risk.

automated scanning
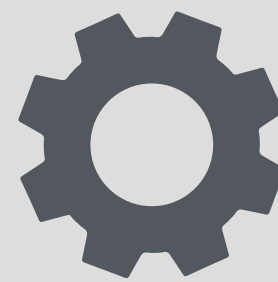

With the right tools anyone can scan a network, but our experienced consultants will help you understand the output. In-line with high industry standards we will perform the scans for you, reporting back with recommendations on the outcomes.

With our experience in manual testing we will confirm that every vulnerability is valid and will remove false positives and duplications, meaning the final report is a real and tangible asset towards your network security defence.

secure coding

code review

What the best way to secure your apps? From the ground up. Our testers can perform reviews to identify vulnerable code, helping you protect against weaknesses before your application is even fully developed. By investing in a secure foundation we can help you feel confidence in the quality of your code and the security of your applications.
